PROJECT DESIGN PHASE-II

Solution Requirements (Functional & Non-functional)

Date	03 October 2026
Team ID	SWTID-2026-3942
Project Name	Import Data using Transform Maps (Spreadsheet)

Functional Requirements

Following are the functional requirements of the proposed solution for importing employee data into ServiceNow and reporting on it.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Prepare employee source data	Create a spreadsheet with a header row and the columns Employee ID, Name, Email, Department and Location, and save it as an Excel (.xlsx) file.
FR-2	Create the target table	Create the Employee Test table (u_employee_test) with Employee ID, Employee Name, Email, Department and Location fields.
FR-3	Load data into an Import Set	Use System Import Sets > Load Data to create the Employee Import staging table (u__employee_import) from the spreadsheet (sheet 1, header row 1).
FR-4	Configure the Transform Map	Create the Sample Spreadsheet Import Transform Map from Employee Import to Employee Test, use Auto Map Matching Fields and map the remaining column manually (5 field maps).
FR-5	Prevent duplicate records	Set Coalesce to true on the Employee ID field map so that a matching Employee ID updates the existing record and a new ID inserts a new one.
FR-6	Convert data where needed	Add field transform scripts for values that need conversion, such as date formats or choice values.
FR-7	Transform and validate	Run the Transform Map, then check Transform History, the Import Set Row states and the Employee Test list against the spreadsheet row count.
FR-8	Handle invalid input	Rows with missing or invalid values must be reported with an error or ignored state while valid rows are still processed; an unsupported file type must be rejected.
FR-9	Generate employee reports	Create an Employee List Report, an Employees by Department pie chart and an Employees by Location bar chart on the Employee Test table.
FR-10	Create the dashboard	Add the three reports to the Employee Analytics Dashboards page in Platform Analytics.

Non-functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	An administrator should be able to follow the import from Load Data to Transform History using standard ServiceNow screens, without writing code.
NFR-2	Data Integrity	Every imported record must keep the correct field mapping, and Employee ID with Coalesce must prevent duplicate employees.
NFR-3	Reliability	Each import must be verifiable through the Complete / Success state, the transform message and Transform History.
NFR-4	Performance	Bulk employee data must be loaded in one import instead of record-by-record entry; a sample transform is expected to finish in under a minute.
NFR-5	Security	Only users with the admin or import_admin role may create data sources, run Transform Maps and write to the target table; dashboard sharing can be limited to users, groups and roles.
NFR-6	Maintainability	The Transform Map, field maps, reports and dashboard must be reusable for later imports, and field maps must be updated if the spreadsheet headers change.
NFR-7	Visibility	Reports and the dashboard must give a central view of employee records by department and location.
